CLeaning to Analysis: Reproducibility-based Interface for Traits and Exposures

Contents 1

2 Contents

	- 4
CHAPTE	R I

Motivation

CLARITE was created to provide an easy-to-use tool for analysis of traits and exposures.

It exists as both a python package (for integration into scripts and/or other packages) and as a command line program.

_				
CH.	AP.	TF	R	_

Installation

At the command line:

\$ pip install clarite

CHAPTER 3

Usage

3.1 Organization of Functions

CLARITE has many functions organized into several different modules:

Analyze Functions related to calculating EWAS results

Describe Functions used to gather information about data

Load Functions used to load data from different formats or sources

Modify Functions used to filter and/or modify data

Plot Functions that generate plots

Survey Functions and classes related to handling data with a complex survey design

3.2 Coding Style

There are three primary ways of using CLARITE'.

1. Using the CLARITE package as part of a python script or Jupyter notebook

This can be done using the function directly:

```
import clarite
df = clarite.load.from_tsv('data.txt')
df_filtered = clarite.modify.colfilter_min_n(df, n=250)
df_filtered_complete = clarite.modify.rowfilter_incomplete_obs(df_filtered)
clarite.plot.distributions(df_filtered_complete, filename='plots.pdf')
```

Or it can be done using Pandas pipe

2. Using the command line tool

```
clarite-cli load from_tsv data/nhanes.txt results/data.txt --index SEQN cd results clarite-cli modify colfilter-min-n data data_filtered -n 250 clarite-cli modify rowfilter-incomplete-obs data_filtered data_filtered_complete clarite-cli plot distributions data_filtered_complete plots.pdf
```

3. Using the GUI (coming soon)

8 Chapter 3. Usage

CHAPTER 4

Example Analysis

CLARITE facilitates the quality control and analysis process for EWAS of metabolic-related traits

[Paper in review]

Data from NHANES was used in an EWAS analysis including utilizing the provided survey weight information. The first two cycles of NHANES (1999-2000 and 2001-2002) are assigned to a 'discovery' dataset and the next two cycles (2003-2004 and 2005-2006) are assigned to a 'replication' datset.

```
import pandas as pd
import numpy as np
from scipy import stats
import clarite
```

```
pd.options.display.max_rows = 10
pd.options.display.max_columns = 6
```

4.1 Load Data

```
data_folder = "../../../data/NHANES_99-06/"
data_main_table_over18 = data_folder + "MainTable_keepvar_over18.tsv"
data_main_table = data_folder + "MainTable.csv"
data_var_description = data_folder + "VarDescription.csv"
data_var_categories = data_folder + "VarCat_nopf.txt"
output = "."
```

4.1.1 Data of all samples with age >= 18

```
# Data
nhanes = clarite.load.from_tsv(data_main_table_over18, index_col="ID")
nhanes.head()
```

```
Loaded 22,624 observations of 970 variables
```

4.1.2 Variable Descriptions

```
# Convert variable descriptions to a dictionary for convenience
var_descr_dict = var_descriptions["var_desc"].to_dict()
```

4.1.3 Survey Weights, as provided by NHANES

Survey weight information is used so that the results apply to the US civillian non-institutionalized population.

This includes:

- SDMVPSU (Cluster ID)
- SDMVSTRA (Nested Strata ID)
- 2-year weights
- · 4-year weights

Different variables require different weights, as many of them were measured on a subset of the full dataset. For example:

- WTINT is the survey weight for interview variables.
- WTMEC is the survey weight for variables measured in the Mobile Exam Centers (a subset of interviewed samples)

2-year and 4-year weights are provided. It is important to adjust the weights when combining multiple cycles, by computing the weighted average. In this case 4-year weights (covering the first 2 cycles) are provided by NHANES and the replication weights (the 3rd and 4th cycles) were computed from the 2-year weights prior to loading them here.

```
# These files map variables to their correct weights, and were compiled by reading_

-throught the NHANES codebook

var_weights = pd.read_csv(data_folder + "weights/VarWeights.csv")

var_weights.head()
```

```
# Convert the data to two dictionaries for convenience
weights_discovery = var_weights.set_index('variable_name')['discovery'].to_dict()
weights_replication = var_weights.set_index('variable_name')['replication'].to_dict()
```

4.1.4 Survey Year data

Survey year is found in a separate file and can be matched using the SEQN ID value.

```
Running merge_variables

left Merge:
    left = 22,624 observations of 970 variables
    right = 41,474 observations of 1 variables

Kept 22,624 observations of 971 variables.
```

4.2 Define the phenotype and covariates

```
BMXBMI = Body Mass Index (kg/m**2)
```

4.3 Initial cleanup / variable selection

4.3.1 Remove any samples missing the phenotype or one of the covariates

```
nhanes = clarite.modify.rowfilter_incomplete_obs(nhanes, only=[phenotype] + □ → covariates)
```

```
Running rowfilter_incomplete_obs

Removed 3,687 of 22,624 observations (16.30%) due to NA values in any of 9 variables
```

4.3.2 Remove variables that aren't appropriate for the analysis

Physical fitness measures

These are measurements rather than proxies for environmental exposures

```
CVDVOMAX = Predicted VO2max (ml/kg/min)

CVDESVO2 = Estimated VO2max (ml/kg/min)

CVDS1HR = Stage 1 heart rate (per min)

CVDS1SY = Stage 1 systolic BP (mm Hg)

CVDS1DI = Stage 1 diastolic BP (mm Hg)

CVDS2HR = Stage 2 heart rate (per min)

CVDS2SY = Stage 2 systolic BP (mm Hg)

CVDS2DI = Stage 2 diastolic BP (mm Hg)

CVDR1HR = Recovery 1 heart rate (per min)

CVDR1SY = Recovery 1 systolic BP (mm Hg)

CVDR1DI = Recovery 1 diastolic BP (mm Hg)

CVDR2HR = Recovery 2 heart rate (per min)

CVDR2SY = Recovery 2 systolic BP (mm Hg)

CVDR2SY = Recovery 2 systolic BP (mm Hg)

CVDR2DI = Recovery 2 diastolic BP (mm Hg)

physical_activity = Physical Activity (MET-based rank)
```

Lipid variables

These are likely correlated with BMI in some way

```
lipid_vars = ["LBDHDD", "LBDHDL", "LBDLDL", "LBXSTR", "LBXTC", "LBXTR"]
print("Removing lipid measurement variables:")
for v in lipid_vars:
    print(f"\t{v} = {var_descr_dict[v]}")
nhanes = nhanes.drop(columns=lipid_vars)
```

```
Removing lipid measurement variables:

LBDHDD = Direct HDL-Cholesterol (mg/dL)

LBDHDL = Direct HDL-Cholesterol (mg/dL)

LBDLDL = LDL-cholesterol (mg/dL)

LBXSTR = Triglycerides (mg/dL)

LBXTC = Total cholesterol (mg/dL)

LBXTR = Triglyceride (mg/dL)
```

Indeterminate variables

These variables don't have clear meanings

```
indeterminent_vars = ["house_type","hepa","hepb", "house_age", "current_past_smoking"]
print("Removing variables with indeterminate meanings:")
```

```
for v in indeterminent_vars:
    print(f"\t{v} = {var_descr_dict[v]}")
nhanes = nhanes.drop(columns=indeterminent_vars)
```

```
Removing variables with indeterminate meanings:
   house_type = house type
   hepa = hepatitis a
   hepb = hepatitis b
   house_age = house age
   current_past_smoking = Current or Past Cigarette Smoker?
```

4.3.3 Recode "missing" values

```
# SMQ077 and DDB100 have Refused/Don't Know for "7" and "9" nhanes = clarite.modify.recode_values(nhanes, {7: np.nan, 9: np.nan}, only=['SMQ077', →'DBD100'])
```

4.3.4 Split the data into discovery and replication

```
discovery = (nhanes['SDDSRVYR']==1) | (nhanes['SDDSRVYR']==2)
replication = (nhanes['SDDSRVYR']==3) | (nhanes['SDDSRVYR']==4)

nhanes_discovery = nhanes.loc[discovery]
nhanes_replication = nhanes.loc[replication]
```

```
nhanes_discovery.head()
```

```
nhanes_replication.head()
```

4.4 QC

4.4.1 Minimum of 200 non-NA values in each variable

Drop variables that have too small of a sample size

4.4. QC 13

```
Running colfilter_min_n

Testing 0 of 0 binary variables
Testing 936 of 945 continuous variables
Removed 302 (32.26%) tested continuous variables which had less than 200 non-null

values.

Running colfilter_min_n

Testing 0 of 0 binary variables
Testing 0 of 0 categorical variables
Testing 0 of 0 categorical variables
Testing 0 of 0 categorical variables
Testing 936 of 945 continuous variables
Testing 936 of 945 continuous variables
Testing 0 of 0 categorical variables
Testing 0 of 0 categorical variables
Testing 0 of 0 categorical variables
Testing 936 of 945 continuous variables
Testing 0 of 0 categorical variables
```

4.4.2 Categorize Variables

This is important, as different variable types must be processed in different ways. The number of unique values for each variable is a good heuristic for determining this. The default settings were used here, but different cutoffs can be specified. CLARITE reports the results in neatly formatted text:

```
nhanes_discovery = clarite.modify.categorize(nhanes_discovery)
nhanes_replication = clarite.modify.categorize(nhanes_replication)
```

```
______
Running categorize
229 of 643 variables (35.61%) are classified as binary (2 unique values).
19 of 643 variables (2.95%) are classified as categorical (3 to 6 unique values).
336 of 643 variables (52.26%) are classified as continuous (>= 15 unique values).
37 of 643 variables (5.75%) were dropped.
   O variables had zero unique values (all NA).
   37 variables had one unique value.
22 of 643 variables (3.42%) were not categorized and need to be set manually.
   22 variables had between 6 and 15 unique values
   0 variables had >= 15 values but couldn't be converted to continuous (numeric)...
→values
Running categorize
236 of 720 variables (32.78%) are classified as binary (2 unique values).
32 of 720 variables (4.44%) are classified as categorical (3 to 6 unique values).
400 of 720 variables (55.56%) are classified as continuous (>= 15 unique values).
13 of 720 variables (1.81%) were dropped.
   O variables had zero unique values (all NA).
   13 variables had one unique value.
39 of 720 variables (5.42%) were not categorized and need to be set manually.
   39 variables had between 6 and 15 unique values
   0 variables had >= 15 values but couldn't be converted to continuous (numeric)
-values
```

4.4.3 Checking categorization

Distributions of variables may be plotted using CLARITE:

One variable needed correcting where the heuristic was not correct

```
v = "L_GLUTAMINE_gm"
print(f"\t{v} = {var_descr_dict[v]}\n")
nhanes_discovery = clarite.modify.make_continuous(nhanes_discovery, only=[v])
nhanes_replication = clarite.modify.make_continuous(nhanes_replication, only=[v])
```

After examining all of the uncategorized variables, they are all continuous

```
WARNING: 22 variables need to be categorized into a type manually

URXUBE = Beryllium, urine (ug/L)

URXUPT = Platinum, urine (ug/L)

DRD350BQ = # of times crabs eaten in past 30 days

DRD350FQ = # of times oysters eaten in past 30 days

DRD350IQ = # of times other shellfish eaten

DRD370AQ = # of times breaded fish products eaten

DRD370DQ = # of times catfish eaten in past 30 days
```

(continues on next page)

4.4. QC 15

```
DRD370EQ = # of times cod eaten in past 30 days
   DRD370FQ = # of times flatfish eaten past 30 days
   DRD370UQ = # of times other unknown fish eaten
   OMEGA_3_FATTY_ACIDS_mg = OMEGA_3_FATTY_ACIDS_mg
   ALANINE_mg = ALANINE_mg

   print()
```

```
Correcting differences in variable types between discovery and replication
Bin vs Cat: BETA_CAROTENE_mcg, CALCIUM_Unknown, MAGNESIUM_Unknown

Running make_categorical

Set 3 of 606 variable(s) as categorical, each with 9,063 observations

Bin vs Cont: LBXPFDO

Running make_continuous

Set 1 of 606 variable(s) as continuous, each with 9,063 observations

Cat vs Cont: DRD350AQ, DRD350DQ, DRD350GQ

Running make_continuous

Set 3 of 606 variable(s) as continuous, each with 9,063 observations

Set 3 of 606 variable(s) as continuous, each with 9,063 observations
```

4.4.4 Filtering

These are a standard set of filters with default settings

```
# 200 non-na samples
discovery_1_min_n = clarite.modify.colfilter_min_n(nhanes_discovery)
replication_1_min_n = clarite.modify.colfilter_min_n(nhanes_replication)
```

```
______
Running colfilter_min_n
Testing 228 of 228 binary variables
   Removed 0 (0.00%) tested binary variables which had less than 200 non-null values.
Testing 15 of 15 categorical variables
   Removed 0 (0.00%) tested categorical variables which had less than 200 non-null_
\rightarrowvalues.
Testing 363 of 363 continuous variables
   Removed 0 (0.00%) tested continuous variables which had less than 200 non-null_
Running colfilter_min_n
Testing 236 of 236 binary variables
   Removed 0 (0.00%) tested binary variables which had less than 200 non-null values.
Testing 31 of 31 categorical variables
   Removed 0 (0.00%) tested categorical variables which had less than 200 non-null.
→values.
Testing 440 of 440 continuous variables
   Removed 0 (0.00%) tested continuous variables which had less than 200 non-null_
______
```

4.4. QC 19

```
Running colfilter_min_cat_n

Testing 230 of 236 binary variables

Removed 154 (66.96%) tested binary variables which had a category with less than 200 values.

Testing 30 of 31 categorical variables

Removed 25 (83.33%) tested categorical variables which had a category with less than 200 values.
```

```
# 90percent zero filter
discovery_3_pzero = clarite.modify.colfilter_percent_zero(discovery_2_min_cat_n)
replication_3_pzero = clarite.modify.colfilter_percent_zero(replication_2_min_cat_n)
```

4.4.5 Summarize

```
# Summarize Results
print("\nDiscovery:")
clarite.describe.summarize(discovery_4_weights)
print('-'*50)
print("Replication:")
clarite.describe.summarize(replication_4_weights)
```

```
Discovery:
9,063 observations of 385 variables
66 Binary Variables
5 Categorical Variables
```

4.4.6 Keep only variables that passed QC in both datasets

```
both = set(list(discovery_4_weights)) & set(list(replication_4_weights))
discovery_final = discovery_4_weights[both]
replication_final = replication_4_weights[both]
print(f"{len(both)} variables in common")
```

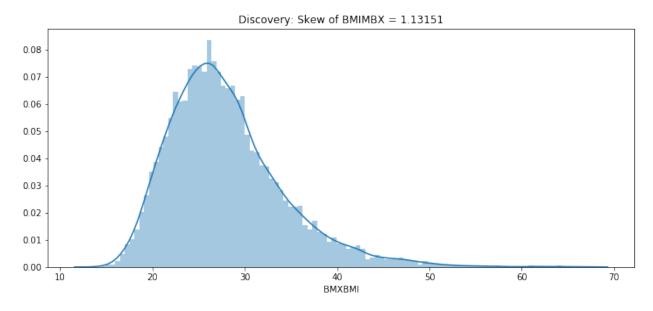

```
341 variables in common
```

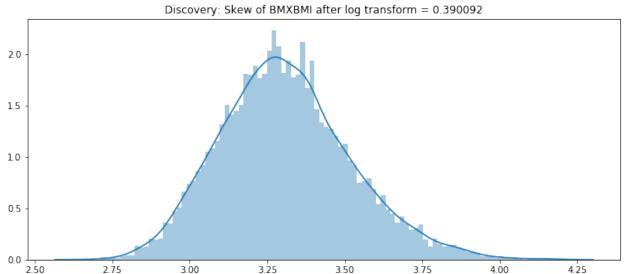

4.5 Checking the phenotype distribution

The phenotype appears to be skewed, so it will need to be corrected. CLARITE makes it easy to plot distributions and to transform variables.

```
Running transform

Transformed 'BMXBMI' using 'log'
```

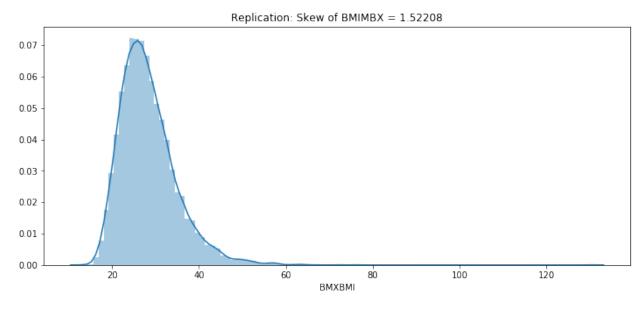

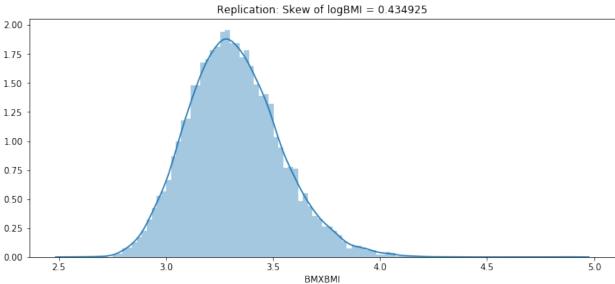

BMXBMI

```
Running transform

Transformed 'BMXBMI' using 'log'
```

4.6 EWAS

4.6.1 Survey Design Spec

When utilizing survey data, a survey design spec object must be created.

4.6. EWAS 23

4.6.2 EWAS

This can then be passed into the EWAS function

```
Running EWAS on a continuous variable

Completed EWAS
```

There is a separate function for adding pvalues with multiple-test-correction applied.

```
clarite.analyze.add_corrected_pvalues(ewas_discovery)
```

Saving results is straightforward

```
ewas_discovery.to_csv(output + "/BMI_Discovery_Results.txt", sep="\t")
```

4.6.3 Selecting top results

Variables with an FDR less than 0.1 were selected (using standard functionality from the Pandas library, since the ewas results are simply a Pandas DataFrame).

```
significant_discovery_variables = ewas_discovery[ewas_discovery['pvalue_fdr']<0.1].

→index.get_level_values('Variable')
print(f"Using {len(significant_discovery_variables)} variables based on FDR-corrected_
→pvalues from the discovery dataset")</pre>
```

```
Using 100 variables based on FDR-corrected pvalues from the discovery dataset
```

4.7 Replication

The variables with low FDR in the discovery dataset were analyzed in the replication dataset

4.7.1 Filter out variables

```
keep_cols = list(significant_discovery_variables) + covariates + [phenotype]
replication_final_sig = clarite.modify.colfilter(replication_final, only=keep_cols)
clarite.describe.summarize(replication_final_sig)
```

4.7.2 Run Replication EWAS

```
survey_design_replication
```

```
Running EWAS on a continuous variable

4.8 Manhattan Plots

CLARITE provides functionality for generating highly customizable Manhattan plots from EWAS results

4.8. Manhattan Plots 31

Weighted EWAS Results

CHAPTER 5

Complex Survey Data

CLARITE provides preliminary support for handling complex survey designs, similar to how the r-package *survey* works.

A SurveyDesignSpec can be created, which is used to obtain survey design objects for specific variables:

There are a few different options for the 'single_cluster' parameter, which controls how strata with single clusters are handled in the linearized covariance calculation:

- error Throw an error
- scaled Use the average value of other strata
- centered Use the average of all observations
- certainty Single-cluster strata don't contribute to the variance

After a SurveyDesignSpec is created, it can be passed into the ewas function to utilize the survey design parameters:

```
ewas_discovery = clarite.analyze.ewas("logBMI", covariates, nhanes_discovery_bin, on the covariates, nhanes_discovery_cat, nhanes_discovery_cont, sd_discovery, cov_method='stata')
```

CHAPTER 6

API Reference

If you are looking for information on a specific function, class or method, this part of the documentation is for you.

6.1 API Reference

CLARITE functions are organized into several modules:

6.1.1 Analyze

EWAS and associated calculations

ewas(phenotype, covariates, data,)	Run an EWAS on a phenotype.
add_corrected_pvalues(ewas_result)	Add bonferroni and FDR pvalues to an ewas re-
	sult and sort by increasing FDR (in-place)

clarite.analyze.ewas

Run an EWAS on a phenotype.

Note:

- Binary variables are treated as continuous features, with values of 0 and 1.
- The results of a likelihood ratio test are used for categorical variables, so no Beta values or SE are reported.

- The regression family is automatically selected based on the type of the phenotype. * Continuous phenotypes use gaussian regression * Binary phenotypes use binomial regression (the larger of the two values is counted as "success")
- Categorical variables run with a survey design will not report Diff_AIC

Parameters

phenotype: string The variable to be used as the output of the regressions

covariates: list (strings), The variables to be used as covariates. Any variables in the DataFrames not listed as covariates are regressed.

data: pd.DataFrame The data to be analyzed, including the phenotype, covariates, and any variables to be regressed.

survey_design_spec: SurveyDesignSpec or None A SurveyDesignSpec object is used to create SurveyDesign objects for each regression.

cov_method: str or None Covariance calculation method (if survey_design_spec is passed in). 'stata' or 'jackknife'

min_n: int or None Minimum number of complete-case observations (no NA values for phenotype, covariates, variable, or weight) Defaults to 200

Returns

```
df: pd.DataFrame EWAS results DataFrame with these columns: ['variable_type', 'N', 'beta', 'SE', 'var_pvalue', 'LRT_pvalue', 'diff_AIC', 'pvalue']
```

Examples

clarite.analyze.add_corrected_pvalues

```
clarite.analyze.add_corrected_pvalues (ewas_result)

Add bonferroni and FDR pvalues to an ewas result and sort by increasing FDR (in-place)
```

Parameters

```
ewas_result: pd.DataFrame EWAS results DataFrame with these columns: ['Variable_type', 'Converged', 'N', 'Beta', 'SE', 'Variable_pvalue', 'LRT_pvalue', 'Diff_AIC', 'pvalue']
```

Returns

None

Examples

```
>>> clarite.analyze.add_corrected_pvalues(ewas_discovery)
```

6.1.2 Describe

Functions that are used to gather information about some data

correlations(data, threshold)	Return variables with pearson correlation above
	the threshold
freq_table(data)	Return the count of each unique value for all bi-
	nary and categorical variables.
get_types(data)	Return the type of each variable
percent_na(data)	Return the percent of observations that are NA for
	each variable
summarize(data)	Print the number of each type of variable and the
	number of observations

clarite.describe.correlations

clarite.describe.correlations (data: pandas.core.frame.DataFrame, threshold: float = 0.75)

Return variables with pearson correlation above the threshold

Parameters

data: pd.DataFrame The DataFrame to be described

threshold: float, between 0 and 1 Return a dataframe listing pairs of variables whose absolute value of correlation is above this threshold

Returns

result: pd.DataFrame DataFrame listing pairs of correlated variables and their correlation value

Examples

```
>>> import clarite
>>> correlations = clarite.describe.correlations(df, threshold=0.9)
>>> correlations.head()
                            var2 correlation
                   var1
0
  supplement_count DSDCOUNT 1.000000
1
          DR1TM181 DR1TMFAT
                                 0.997900
2
          DR1TP182 DR1TPFAT
                                 0.996172
3
                                 0.987974
          DRD370FQ DRD370UQ
4
          DR1TS160 DR1TSFAT
                                 0.984733
```

clarite.describe.freq table

```
clarite.describe.freq_table(data: pandas.core.frame.DataFrame)
```

Return the count of each unique value for all binary and categorical variables. Other variables will return a single row with a value of '<Non-Categorical Values>' and the number of non-NA values.

Parameters

data: pd.DataFrame The DataFrame to be described

Returns

result: pd.DataFrame DataFrame listing variable, value, and count for each categorical variable

Examples

```
>>> import clarite
>>> clarite.describe.freq_table(df).head(n=10)
   variable value count
0
                                                2 4872

  how_many_years_in_house
9
             LBXPFDO <Non-Categorical Values> 1032
```

clarite.describe.get_types

clarite.describe.get_types (data: pandas.core.frame.DataFrame)
Return the type of each variable

Parameters

data: pd.DataFrame The DataFrame to be described

Returns

result: pd.Series Series listing the CLARITE type for each variable

Examples

```
>>> import clarite
>>> clarite.describe.get_types(df).head()
RIDAGEYR continuous
female binary
black binary
mexican binary
other_hispanic binary
dtype: object
```

clarite.describe.percent na

clarite.describe.percent_na (data: pandas.core.frame.DataFrame)
Return the percent of observations that are NA for each variable

Parameters

data: pd.DataFrame The DataFrame to be described

Returns

result: pd.DataFrame DataFrame listing percent NA for each variable

Examples

```
>>> import clarite
>>> clarite.describe.percent_na(df)
    variable percent_na
0 SDDSRVYR     0.00000
1 female     0.00000
2 LBXHBC     4.99321
3 LBXHBS     4.98730
```

clarite.describe.summarize

clarite.describe.summarize(data: pandas.core.frame.DataFrame)

Print the number of each type of variable and the number of observations

Parameters

data: pd.DataFrame The DataFrame to be described

Returns

result: None

Examples

```
>>> import clarite
>>> clarite.describe.get_types(df).head()
RIDAGEYR continuous
female binary
black binary
mexican binary
other_hispanic binary
dtype: object
```

6.1.3 Load

Load data from different formats or sources

<pre>from_tsv(filename, index_col, int,)</pre>	Load data from a tab-separated file into a
	DataFrame
from_csv(filename, index_col, int,)	Load data from a comma-separated file into a
	DataFrame

clarite.load.from_tsv

Parameters

filename: str or Path File with data to be used in CLARITE

index_col: int or string (default 0) Column to use as the row labels of the DataFrame.

**kwargs: Other keword arguments to pass to pd.read_csv

Returns

DataFrame The index column will be used when merging

Examples

Load a tab-delimited file with an "ID" column

```
>>> import clarite
>>> df = clarite.import.from_tsv('nhanes.txt', index_col="SEQN")
Loaded 22,624 observations of 970 variables
```

clarite.load.from csv

Load data from a comma-separated file into a DataFrame

Parameters

filename: str or Path File with data to be used in CLARITE

index_col: int or string (default 0) Column to use as the row labels of the DataFrame.

**kwargs: Other keword arguments to pass to pd.read_csv

Returns

DataFrame The index column will be used when merging

Examples

Load a tab-delimited file with an "ID" column

```
>>> import clarite
>>> df = clarite.import.from_csv('nhanes.csv', index_col="SEQN")
Loaded 22,624 observations of 970 variables
```

6.1.4 Modify

Functions used to filter and/or change some data, always taking in one set of data and returning one set of data.

categorize(data,	cat_min,	cat_max,	Classify variables into binary, categorical, contin-
cont_min)			uous, and 'unknown'.

Continued on next page

Table 4 – continued from previous page

colfilter(data, skip, List[str],)	Remove some variables (skip) or keep only cer-
	tain variables (only)
colfilter_percent_zero(data, fil-	Remove continuous variables which have <pro-< th=""></pro-<>
ter_percent,)	portion> or more values of zero (excluding NA)
colfilter_min_n(data, n, skip, List[str],	Remove variables which have less than <n> non-</n>
)	NA values
colfilter_min_cat_n(data, n, skip,)	Remove binary and categorical variables which
	have less than <n> occurences of each unique</n>
	value
make_binary(data, skip, List[str],)	Set variable types as Binary
make_categorical(data, skip, List[str],)	Set variable types as Categorical
make_continuous(data, skip, List[str],)	Set variable types as Numeric
merge_observations(top, bottom)	Merge two datasets, keeping only the columns
	present in both.
merge_variables(left, right, how)	Merge a list of dataframes with different variables
	side-by-side.
move_variables(left, right, skip, List[str],	Move one or more variables from one DataFrame
)	to another
recode_values(data, replacement_dict, skip,	Convert values in a dataframe.
)	
remove_outliers(data, method[, cutoff])	Remove outliers from continuous variables by re-
	placing them with np.nan
rowfilter_incomplete_obs(data, skip,	Remove rows containing null values
)	
transform(data, transform_method, skip,)	Apply a transformation function to a variable

clarite.modify.categorize

Classify variables into binary, categorical, continuous, and 'unknown'. Drop variables that only have NaN values.

Parameters

data: pd.DataFrame The DataFrame to be processed

cat_min: int, default 3 Minimum number of unique, non-NA values for a categorical variable

cat_max: int, default 6 Maximum number of unique, non-NA values for a categorical variable

cont_min: int, default 15 Minimum number of unique, non-NA values for a continuous variable

Returns

result: pd.DataFrame or None If inplace, returns None. Changes the datatypes on the input DataFrame.

Examples

```
>>> import clarite
>>> clarite.modify.categorize(nhanes)
362 of 970 variables (37.32%) are classified as binary (2 unique values).
47 of 970 variables (4.85%) are classified as categorical (3 to 6 unique...
+values).
483 of 970 variables (49.79%) are classified as continuous (>= 15 unique...
+values).
42 of 970 variables (4.33%) were dropped.

10 variables had zero unique values (all NA).
32 variables had one unique value.
36 of 970 variables (3.71%) were not categorized and need to be set...
+manually.
36 variables had between 6 and 15 unique values
0 variables had >= 15 values but couldn't be converted to...
+continuous (numeric) values
```

clarite.modify.colfilter

Parameters

```
data: pd.DataFrame The DataFrame to be processed and returnedskip: str, list or None (default is None) List of variables to removeonly: str, list or None (default is None) List of variables to keep
```

Returns

data: pd.DataFrame The filtered DataFrame

Examples

clarite.modify.colfilter percent zero

```
clarite.modify.colfilter_percent_zero (data: pandas.core.frame.DataFrame, fil-

ter_percent: float = 90.0, skip: Union[str,

List[str], NoneType] = None, only:

Union[str, List[str], NoneType] = None)

Remove continuous variables which have proportion> or more values of zero (excluding NA)
```

Parameters

data: pd.DataFrame The DataFrame to be processed and returned

filter_percent: float, default 90.0 If the percentage of rows in the data with a value of zero is greater than or equal to this value, the variable is filtered out.

skip: str, list or None (default is None) List of variables that the filter should *not* be applied to

only: str, list or None (default is None) List of variables that the filter should *only* be applied to

Returns

data: pd.DataFrame The filtered DataFrame

Examples

clarite.modify.colfilter_min_n

Parameters

data: pd.DataFrame The DataFrame to be processed and returned

n: int, default 200 The minimum number of unique values required in order for a variable not to be filtered

skip: str, list or None (default is None) List of variables that the filter should *not* be applied to

only: str, list or None (default is None) List of variables that the filter should *only* be applied to

Returns

data: pd.DataFrame The filtered DataFrame

Examples

```
>>> import clarite
>>> nhanes_filtered = clarite.modify.colfilter_min_n(nhanes)
Running colfilter_min_n
WARNING: 36 variables need to be categorized into a type manually
Testing 362 of 362 binary variables
      Removed 12 (3.31%) tested binary variables which had less than,
→200 non-null values
Testing 47 of 47 categorical variables
      Removed 8 (17.02%) tested categorical variables which had less_
→than 200 non-null values
Testing 483 of 483 continuous variables
      Removed 8 (1.66%) tested continuous variables which had less.
→than 200 non-null values
```

clarite.modify.colfilter_min_cat_n

```
clarite.modify.colfilter min cat n (data, n: int = 200, skip: Union[str, List[str],
                                              NoneType] = None, only: Union[str, List[str],
                                              NoneType | = None
```

Remove binary and categorical variables which have less than <n> occurences of each unique value

Parameters

data: pd.DataFrame The DataFrame to be processed and returned

n: int, default 200 The minimum number of occurences of each unique value required in order for a variable not to be filtered

skip: str, list or None (default is None) List of variables that the filter should not be applied to

only: str, list or None (default is None) List of variables that the filter should only be applied to

Returns

data: pd.DataFrame The filtered DataFrame

Examples

```
>>> import clarite
>>> nhanes_filtered = clarite.modify.colfilter_min_cat_n(nhanes)
______
Running colfilter_min_cat_n
WARNING: 36 variables need to be categorized into a type manually
```

(continues on next page)

(continued from previous page)

```
Testing 362 of 362 binary variables

Removed 248 (68.51%) tested binary variables which had a 

→ category with less than 200 values

Testing 47 of 47 categorical variables

Removed 36 (76.60%) tested categorical variables which had a 

→ category with less than 200 values
```

clarite.modify.make_binary

Set variable types as Binary

Checks that each variable has at most 2 values and converts the type to pd.Categorical.

Note: When these variables are used in regression, they are ordered by value. For example, Sex (Male=1, Female=2) will encode "Male" as 0 and "Female" as 1 during the EWAS regression step.

Parameters

data: pd.DataFrame or pd.Series Data to be processed

skip: str, list or None (default is None) List of variables that should *not* be made binary

only: str, list or None (default is None) List of variables that are the *only* ones to be made binary

Returns

data: pd.DataFrame DataFrame with the same data but validated and converted to binary types

Examples

clarite.modify.make_categorical

Set variable types as Categorical

Converts the type to pd.Categorical

Parameters

data: pd.DataFrame or pd.Series Data to be processed

skip: str, list or None (default is None) List of variables that should *not* be made categorical

only: str, list or None (default is None) List of variables that are the *only* ones to be made categorical

Returns

data: pd.DataFrame DataFrame with the same data but validated and converted to categorical types

Examples

clarite.modify.make continuous

Set variable types as Numeric

Converts the type to numeric

Parameters

data: pd.DataFrame or pd.Series Data to be processed

skip: str, list or None (default is None) List of variables that should *not* be made continuous

only: str, list or None (default is None) List of variables that are the *only* ones to be made continuous

Returns

data: pd.DataFrame DataFrame with the same data but validated and converted to numeric types

Examples

clarite.modify.merge_observations

```
clarite.modify.merge_observations(top: pandas.core.frame.DataFrame, bottom: pandas.core.frame.DataFrame)
```

Merge two datasets, keeping only the columns present in both. Raise an error if a datatype conflict occurs.

Parameters

top: pd.DataFrame "top" DataFrame

bottom: pd.DataFrame "bottom" DataFrame

Returns

result: pd.DataFrame

clarite.modify.merge_variables

```
clarite.modify.merge_variables(left: pandas.core.frame.DataFrame, right: pan-
das.core.frame.DataFrame, how: str = 'outer')
```

Merge a list of dataframes with different variables side-by-side. Keep all observations ('outer' merge) by default.

Parameters

left: pd.Dataframe "left" DataFrame

right: pd.DataFrame "right" DataFrame which uses the same index

how: merge method, one of {'left', 'right', 'inner', 'outer'} Keep only rows present in the left data, the right data, both datasets, or either dataset.

Examples

```
>>> import clarite
>>> df = clarite.modify.merge_variables(df_bin, df_cat, how='outer')
```

clarite.modify.move variables

Move one or more variables from one DataFrame to another

Parameters

left: pd.Dataframe DataFrame containing the variable(s) to be moved

right: pd.DataFrame DataFrame (which uses the same index) that the variable(s) will be moved to

skip: str, list or None (default is None) List of variables that will not be moved

only: str, list or None (default is None) List of variables that are the *only* ones to be moved

Returns

left: pd.DataFrame The first DataFrame with the variables removed **right: pd.DataFrame** The second DataFrame with the variables added

Examples

clarite.modify.recode_values

Convert values in a dataframe. By default, replacement occurs in all columns but this may be modified with 'skip' or 'only'. Pandas has more powerful 'replace' methods for more complicated scenarios.

Parameters

data: pd.DataFrame The DataFrame to be processed and returned

replacement_dict: dictionary A dictionary mapping the value being replaced to the value being inserted

skip: str, list or None (default is None) List of variables that the replacement should *not* be applied to

only: str, list or None (default is None) List of variables that the replacement should only be applied to

Examples

clarite.modify.remove outliers

```
clarite.modify.remove_outliers (data, method: str = 'gaussian', cutoff=3, skip:
Union[str, List[str], NoneType] = None, only:
Union[str, List[str], NoneType] = None)
```

Remove outliers from continuous variables by replacing them with np.nan

Parameters

data: pd.DataFrame The DataFrame to be processed and returned

method: string, 'gaussian' (default) or 'iqr' Define outliers using a gaussian approach (standard deviations from the mean) or inter-quartile range

cutoff: positive numeric, default of 3 Either the number of standard deviations from the mean (method='gaussian') or the multiple of the IQR (method='iqr') Any values equal to or more extreme will be replaced with np.nan

skip: str, list or None (default is None) List of variables that the replacement should *not* be applied to

only: str, list or None (default is None) List of variables that the replacement should only be applied to

Examples

```
>>> import clarite
>>> nhanes_rm_outliers = clarite.modify.remove_outliers(nhanes, method=
→'iqr', cutoff=1.5, only=['DR1TVB1', 'URXP07', 'SMQ077'])
Running remove outliers
WARNING: 36 variables need to be categorized into a type manually
Removing outliers from 2 continuous variables with values < 1st Quartile_
\rightarrow- (1.5 * IQR) or > 3rd quartile + (1.5 * IQR)
        Removed 0 low and 430 high IQR outliers from URXP07 (outside -
\hookrightarrow153.55 to 341.25)
        Removed 0 low and 730 high IQR outliers from DR1TVB1 (outside -0.
\hookrightarrow47 to 3.48)
>>> nhanes_rm_outliers = clarite.modify.remove_outliers(nhanes, only=[
→'DR1TVB1', 'URXP07'])
Running remove outliers
WARNING: 36 variables need to be categorized into a type manually
Removing outliers from 2 continuous variables with values more than 3,
\hookrightarrowstandard deviations from the mean
        Removed 0 low and 42 high gaussian outliers from URXP07 (outside,
\rightarrow-1,194.83 to 1,508.13)
        Removed 0 low and 301 high gaussian outliers from DR1TVB1
\hookrightarrow (outside -1.06 to 4.27)
```

clarite.modify.rowfilter_incomplete_obs

Remove rows containing null values

Parameters

data: pd.DataFrame The DataFrame to be processed and returned

skip: str, list or None (default is None) List of columns that are not checked for null values

only: str, list or None (default is None) List of columns that are the only ones to be checked for null values

Returns

data: pd.DataFrame The filtered DataFrame

Examples

clarite.modify.transform

Apply a transformation function to a variable

Parameters

data: pd.DataFrame or pd.Series Data to be processed

transform_method: str Name of the transformation (Python function or NumPy ufunc to apply)

skip: str, list or None (default is None) List of variables that will not be transformed

only: str, list or None (default is None) List of variables that are the *only* ones to be transformed

Returns

data: pd.DataFrame DataFrame with variables that have been transformed

Examples

6.1.5 Plot

Functions that generate plots

histogram(data, column, figsize, int] =	(12,	Plot a histogram of the values in the given col-
)		umn.
distributions(data, filename,)		Create a pdf containing histograms for each bi-
		nary or categorical variable, and one of several
		types of plots for each continuous variable.
manhattan(dfs,	pan-	Create a Manhattan-like plot for a list of EWAS
das.core.frame.DataFrame],)		Results

clarite.plot.histogram

Plot a histogram of the values in the given column. Takes kwargs for seaborn's distplot.

Parameters

```
data: pd.DataFrame The DataFrame containing data to be plotted
```

column: string The name of the column that will be plotted

figsize: tuple(int, int), default (12, 5) The figure size of the resulting plot

title: string or None, default None The title used for the plot

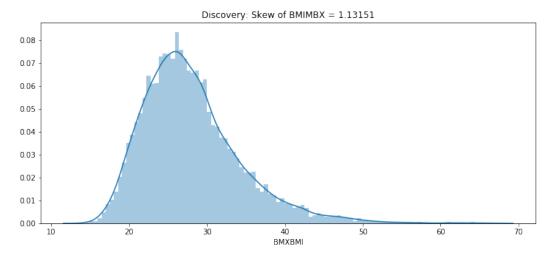

figure: matplotlib Figure or None, default None Pass in an existing figure to plot to that instead of creating a new one (ignoring figsize)

**kwargs: Other keyword arguments to pass to the distplot function of Seaborn

Returns

None

Examples

clarite.plot.distributions

clarite.plot.distributions (data, filename: str, continuous_kind: str = 'count', nrows:

int = 4, ncols: int = 3, quality: str = 'medium', variables:

Union[List[str], NoneType] = None, sort: bool = True)

Create a pdf containing histograms for each binary or categorical variable, and one of several tyre

Create a pdf containing histograms for each binary or categorical variable, and one of several types of plots for each continuous variable.

Parameters

data: pd.DataFrame The DataFrame containing data to be plotted

filename: string Name of the saved pdf file. The extension will be added automatically if it was not included.

continuous_kind: string What kind of plots to use for continuous data. Binary and Categorical variables will always be shown with histograms. One of {'count', 'box', 'violin', 'qq'}

nrows: int (default=4) Number of rows per page

ncols: int (default=3) Number of columns per page

quality: 'low', 'medium', or 'high' Adjusts the DPI of the plots (150, 300, or 1200)

variables: List[str] or None Which variables to plot. If None, all variables are plotted.

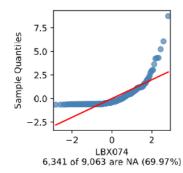

sort: Boolean (default=True) Whether or not to sort variable names

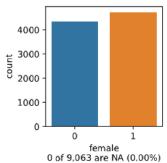

Returns

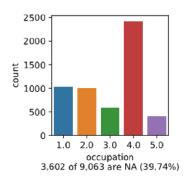

None

Examples

```
>>> import clarite
>>> clarite.plot.distributions(df[['female', 'occupation', 'LBX074']],,,
→filename="test")

```

clarite.plot.manhattan

clarite.plot.manhattan (dfs: Dict[str, pandas.core.frame.DataFrame], categories:

Dict[str, str] = {}, num_labeled: int = 3, label_vars: List[str] = [], figsize: Tuple[int, int] = (12, 6), dpi: int = 300, title:

Union[str, NoneType] = None, figure: Union[figure, None-Type] = None, colors: List[str] = ['#53868B', '#4D4D4D'], background_colors: List[str] = ['#EBEBEB', '#FFFFFF'], filename: Union[str, NoneType] = None)

Create a Manhattan-like plot for a list of EWAS Results

Parameters

dfs: DataFrame Dictionary of dataset names to pandas dataframes of ewas results (requires certain columns)

categories: dictionary (string: string) A dictionary mapping each variable name to a category name

num_labeled: int, default 3 Label the top <num_labeled> results with the variable
name

label_vars: list of strings, default empty list Label the named variables

figsize: tuple(int, int), default (12, 6) The figure size of the resulting plot in inches dpi: int, default 300 The figure dots-per-inch

title: string or None, default None The title used for the plot

figure: matplotlib Figure or None, default None Pass in an existing figure to plot to that instead of creating a new one (ignoring figsize and dpi)

colors: List(string, string), default ["#53868B", "#4D4D4D"] A list of colors to use for alternating categories (must be same length as 'background_colors')

background_colors: List(string, string), default ["#EBEBEB", "#FFFFFF"] A list of background colors to use for alternating categories (must be same length as 'colors')

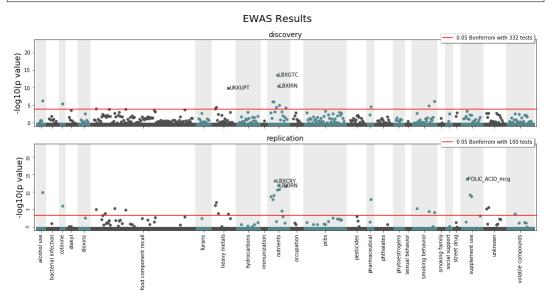

filename: Optional str If provided, a copy of the plot will be saved to the specified file

Returns

None

Examples

6.1.6 Survey

Complex survey design

SurveyDesignSpec(survey_df, strata, clus-	Holds parameters for building a statsmodels Sur-
ter,)	veyDesign object

clarite.survey.SurveyDesignSpec

```
class clarite.survey.SurveyDesignSpec (survey_df: pan-
das.core.frame.DataFrame, strata:
Optional[str] = None, cluster: Op-
tional[str] = None, nest: bool = False,
weights: Union[str, Dict[str, str]] = None,
fpc: Optional[str] = None, single_cluster:
Optional[str] = 'error')
```

Holds parameters for building a statsmodels SurveyDesign object

Parameters

survey_df: pd.DataFrame A DataFrame containing Cluster, Strata, and/or weights
data

strata: string or None The name of the strata variable in the survey_df

cluster: string or None The name of the cluster variable in the survey_df

nest: bool, default False Whether or not the clusters are nested in the strata (The same cluster IDs are repeated in different strata)

weights: string or dictionary(string:string) The name of the weights variable in the survey_df, or a dictionary mapping variable names to weight names

fpc: string or None The name of the variable in the survey_df that contains the finite population correction information. This reduces variance when a substantial portion of the population is sampled. May be specified as the total population size, or the fraction of the population that was sampled.

single_cluster: str Setting controlling variance calculation in single-cluster ('lonely psu') strata 'error': default, throw an error 'scaled': use the average value of other strata 'centered': use the average of all observations 'certainty': that strata doesn't contribute to the variance

Examples

__init___(self, survey_df: pandas.core.frame.DataFrame, strata: Union[str, NoneType] = None, cluster: Union[str, NoneType] = None, nest: bool = False, weights: Union[str, Dict[str, str]] = None, fpc: Union[str, NoneType] = None, single_cluster: Union[str, NoneType] = 'error')
Initialize self. See help(type(self)) for accurate signature.

Methods

init(self, survey_df, strata,)		Initialize self.
get_survey_design(self,	regres-	Build a survey design based on the regression
sion_variable,)		variable

CHAPTER 7

CLI Reference

Documentation for using the CLI

7.1 CLI Reference

Once CLARITE is installed, the command line interface can be run using the clarte-cli command.

The command line interface has command groups that are the same as the modules in the package (except for survey).

The --help option will show documentation when run with any command or command group:

```
$ clarite-cli --help
Usage: clarite-cli [OPTIONS] COMMAND [ARGS]...

Options:
--help Show this message and exit.

Commands:
   analyze
   describe
   load
   modify
   plot
```

7.1.1 –skip and –only

Many commands in the CLI have the *skip* and *only* options. These will limit the command to specific variables. If *skip* is specified, all variables except the specified ones will be processed. If *only* is specified, only the specified variables will be processed.

Only one or the other option may be used in a single command. They may be passed in any combination of two ways:

1. As the name of a file containing one variable name per line

2. As the variable name specfied directly in the terminal

For example:

results in:

7.1.2 Commands

clarite-cli analyze

```
clarite-cli analyze [OPTIONS] COMMAND [ARGS]...
```

add-corrected-pvals

Get FDR-corrected and Bonferroni-corrected pvalues

```
clarite-cli analyze add-corrected-pvals [OPTIONS] EWAS_RESULT OUTPUT
```

Arguments

EWAS_RESULT

Required argument

OUTPUT

Required argument

ewas

Run an EWAS analysis

```
clarite-cli analyze ewas [OPTIONS] PHENOTYPE DATA OUTPUT
```

Options

Options stataljackknife

--min-n <min_n>

Minimum number of complete cases needed to run a regression

--survey-data <survey_data>

Tab-separated data file with survey weights, strata IDs, and/or cluster IDs. Must have an 'ID' column.

--strata <strata>

Name of the strata column in the survey data

--cluster <cluster>

Name of the cluster column in the survey data

--nested, --not-nested

Whether survey data is nested or not

--weights-file <weights_file>

Tab-delimited data file with 'Variable' and 'Weight' columns to match weights from the survey data to specific variables

-w, --weight <weight>

Name of a survey weight column found in the survey data. This option can't be used with -weights-file

--single-cluster <single_cluster>

How to handle singular clusters

Options errorlscaledlcenteredlcertainty

Arguments

PHENOTYPE

Required argument

DATA

Required argument

OUTPUT

Required argument

get-significant

filter out non-significant results

```
clarite-cli analyze get-significant [OPTIONS] EWAS_RESULT OUTPUT
```

Options

--fdr, --bonferroni

Use FDR (-fdr) or Bonferroni pvalues (-bonferroni). FDR by default.

-p, --pvalue <pvalue>

Keep results with a pvalue <= this value (0.05 by default)

7.1. CLI Reference 59

Arguments

EWAS RESULT

Required argument

OUTPUT

Required argument

clarite-cli describe

clarite-cli describe [OPTIONS] COMMAND [ARGS]...

correlations

Report top correlations between variables

clarite-cli describe correlations [OPTIONS] DATA OUTPUT

Options

-t, --threshold <threshold>
 Report correlations with R >= this value

Arguments

DATA

Required argument

OUTPUT

Required argument

freq-table

Report the number of occurences of each value for each variable

clarite-cli describe freq-table [OPTIONS] DATA OUTPUT

Arguments

DATA

Required argument

OUTPUT

Required argument

get-types

Get the type of each variable

clarite-cli describe get-types [OPTIONS] DATA OUTPUT

Arguments

DATA

Required argument

OUTPUT

Required argument

percent-na

Report the percent of observations that are NA for each variable

clarite-cli describe percent-na [OPTIONS] DATA OUTPUT

Arguments

DATA

Required argument

OUTPUT

Required argument

clarite-cli load

```
clarite-cli load [OPTIONS] COMMAND [ARGS]...
```

from-csv

Load data from a comma-separated file and save it in the standard format

```
clarite-cli load from-csv [OPTIONS] INPUT OUTPUT
```

Options

- -i, --index <index>
 - Name of the column to use as the index. Default is the first column.
- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

7.1. CLI Reference 61

Arguments

INPUT

Required argument

OUTPUT

Required argument

from-tsv

Load data from a tab-separated file and save it in the standard format

```
clarite-cli load from-tsv [OPTIONS] INPUT OUTPUT
```

Options

-i, --index <index>

Name of the column to use as the index. Default is the first column.

- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

INPUT

Required argument

OUTPUT

Required argument

clarite-cli modify

```
clarite-cli modify [OPTIONS] COMMAND [ARGS]...
```

categorize

Categorize data based on the number of unique values

```
clarite-cli modify categorize [OPTIONS] DATA OUTPUT
```

Options

```
--cat_min <cat_min>
```

Minimum number of unique values in a variable to make it a categorical type

```
--cat_max <cat_max>
```

Maximum number of unique values in a variable to make it a categorical type

```
--cont_min <cont_min>
```

Minimum number of unique values in a variable to make it a continuous type

Arguments

DATA

Required argument

OUTPUT

Required argument

colfilter

Remove some variables from a dataset

```
clarite-cli modify colfilter [OPTIONS] DATA OUTPUT
```

Options

- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

OUTPUT

Required argument

colfilter-min-cat-n

Filter variables based on a minimum number of non-NA observations per category

```
clarite-cli modify colfilter-min-cat-n [OPTIONS] DATA OUTPUT
```

Options

-n <n>

Remove variables with less than this many non-na observations in each category

- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

7.1. CLI Reference 63

Arguments

DATA

Required argument

OUTPUT

Required argument

colfilter-min-n

Filter variables based on a minimum number of non-NA observations

```
clarite-cli modify colfilter-min-n [OPTIONS] DATA OUTPUT
```

Options

-n <n>

Remove variables with less than this many non-na observations

- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

OUTPUT

Required argument

colfilter-percent-zero

Filter variables based on the fraction of observations with a value of zero

```
clarite-cli modify colfilter-percent-zero [OPTIONS] DATA OUTPUT
```

Options

- -p, --filter-percent <filter_percent>
 Remove variables when the percentage of observations equal to 0 is >= this value (0 to 100)
- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

OUTPUT

Required argument

make-binary

Set the type of variables to 'binary'

```
clarite-cli modify make-binary [OPTIONS] DATA OUTPUT
```

Options

```
-s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
```

```
-o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.
```

Arguments

DATA

Required argument

OUTPUT

Required argument

make-categorical

Set the type of variables to 'categorical'

```
clarite-cli modify make-categorical [OPTIONS] DATA OUTPUT
```

Options

```
-s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
```

```
-o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.
```

Arguments

DATA

Required argument

OUTPUT

Required argument

7.1. CLI Reference 65

make-continuous

Set the type of variables to 'continuous'

clarite-cli modify make-continuous [OPTIONS] DATA OUTPUT

Options

- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

OUTPUT

Required argument

merge-observations

Merge observations from two different datasets into one

clarite-cli modify merge-observations [OPTIONS] TOP BOTTOM OUTPUT

Arguments

TOP

Required argument

BOTTOM

Required argument

OUTPUT

Required argument

merge-variables

Merge variables from two different datasets into one

clarite-cli modify merge-variables [OPTIONS] LEFT RIGHT OUTPUT

Options

-h, --how <how>
 Type of Merge

Options leftlrightlinnerlouter

Arguments

LEFT

Required argument

RIGHT

Required argument

OUTPUT

Required argument

move-variables

Move variables from one dataset to another

```
clarite-cli modify move-variables [OPTIONS] LEFT RIGHT
```

Options

```
--output_left <output_left>
--output_right <output_right>
-s, --skip <skip>
    variables to skip. Either individual names, or a file containing one name per line.
-o, --only <only>
    variables to process, skipping all others. Either individual names, or a file containing one name per line.
```

Arguments

LEFT

Required argument

RIGHT

Required argument

recode-values

Replace values in the data with other values. The value being replaced ('current') and the new value ('replacement') are specified with their type, and only one may be included for each. If it is not specified, the value being replaced or being inserted is None.

```
clarite-cli modify recode-values [OPTIONS] DATA OUTPUT
```

Options

```
--current-str <cs>
    Replace occurences of this string value
--current-int <ci>
    Replace occurences of this integer value
```

7.1. CLI Reference 67

--current-float <cf>

Replace occurences of this float value

--replacement-str <rs>

Insert this string value

--replacement-int <ri>

Insert this integer value

--replacement-float <rf>

Insert this float value

-s, --skip <skip>

variables to skip. Either individual names, or a file containing one name per line.

-o, --only <only>

variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

OUTPUT

Required argument

remove-outliers

Replace outlier values with NaN. Outliers are defined using a gaussian or IQR approach.

```
clarite-cli modify remove-outliers [OPTIONS] DATA OUTPUT
```

Options

-m, --method <method>

Options gaussianliqr

- -c, --cutoff <cutoff>
- -s, --skip <skip>

variables to skip. Either individual names, or a file containing one name per line.

-o, --only <only>

variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

OUTPUT

Required argument

rowfilter

Select some rows from a dataset using a simple comparison, keeping rows where the comparison is True.

clarite-cli modify rowfilter [OPTIONS] DATA OUTPUT COLUMN

Options

--value-str <vs>

Compare values in the column to this string

--value-int <vi>

Compare values in the column to this integer

--value-float <vf>

Compare values in the column to this floating point number

-c, --comparison <comparison>

Keep rows where the value of the column is lt (<), lte (<=), eq (==), gte (>=), or gt (>) the specified value. Eq by default.

Options Itllteleqlgtelgt

Arguments

DATA

Required argument

OUTPUT

Required argument

COLUMN

Required argument

rowfilter-incomplete-obs

Filter out observations that are not complete cases (contain no NA values)

```
clarite-cli modify rowfilter-incomplete-obs [OPTIONS] DATA OUTPUT
```

Options

```
-s, --skip <skip>
```

variables to skip. Either individual names, or a file containing one name per line.

-o, --only <only>

variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

7.1. CLI Reference 69

OUTPUT

Required argument

transform-variable

Apply a function to each value of a variable

clarite-cli modify transform-variable [OPTIONS] DATA OUTPUT TRANSFORM_METHOD

Options

- -s, --skip <skip> variables to skip. Either individual names, or a file containing one name per line.
- -o, --only <only> variables to process, skipping all others. Either individual names, or a file containing one name per line.

Arguments

DATA

Required argument

OUTPUT

Required argument

TRANSFORM_METHOD

Required argument

clarite-cli plot

```
clarite-cli plot [OPTIONS] COMMAND [ARGS]...
```

distributions

Generate a pdf containing distribution plots for each variable

```
clarite-cli plot distributions [OPTIONS] DATA OUTPUT
```

Options

70

-k, --kind <kind>

Kind of plot used for continuous data. Non-continuous always shows a count plot.

Options countlbox|violin|qq

--nrows <nrows>

Number of rows per page

--ncols <ncols>

Number of columns per page

```
-q, --quality <quality>
```

Quality of the generated plots: low (150 dpi), medium (300 dpi), or high (1200 dpi).

Options lowlmediumlhigh

--sort, --no-sort

Sort variables alphabetically

Arguments

DATA

Required argument

OUTPUT

Required argument

histogram

Create a histogram plot of a variable

clarite-cli plot histogram [OPTIONS] DATA OUTPUT VARIABLE

Arguments

DATA

Required argument

OUTPUT

Required argument

VARIABLE

Required argument

manhattan

Generate a manhattan plot of EWAS results

```
clarite-cli plot manhattan [OPTIONS] EWAS_RESULT OUTPUT
```

Options

```
-c, --categories <categories>
    tab-separate file with two columns: 'Variable' and 'category'
```

-o, --other <other>
 other datasets to include in the plot

--nlabeled <nlabeled>
label top n points

--label <label>

label points by name

7.1. CLI Reference 71

Arguments

EWAS_RESULT

Required argument

OUTPUT

CHAPTER 8

Additional Notes

Release History, etc

8.1 Release History

8.1.1 v0.9.1 (2019-11-20)

Minor documentation update

8.1.2 v0.9.0 (2019-10-31)

Enhancements

- Add a figure parameter to histogram and manhattan plots in order to plot to an existing figure
- SurveyDesignSpec can now utilize more parameters, such as fpc
- The larger (numeric or alphabetic) binary variable is always treated as the success case for binary phenotypes
- Improved logging during EWAS, including printing the survey design information
- Extensively updated documentation
- CLARITE now has a logo!

Fixes

- · Corrected an indexing error that sometimes occurred when removing rows with missing weights
- Improve precision in EWAS results for weighted analyses by using sf instead of 1-cdf
- Change some column names in the EWAS output to be more clear

Tests

An R script and the output of that script is now included. The R output is compared to the python output in the test suite in order to ensure analysis result concordance between R and Python for several analysis scenarios.

8.1.3 v0.8.0 (2019-09-03)

Enhancements

- Allow file input in the command line for skip/only
- Make the manhattan plot function less restrictive of the data passed into it
- Use skip/only in the transform function

Fixes

• Categorization would silently fail if there was only one variable of a given type

8.1.4 v0.7.0 (2019-07-23)

Enhancements

- Improvements to the CLI and printed log messages.
- The functions from the 'Process' module were put into the 'Modify' module.
- Datasets are no longer split apart when categorizing.

8.1.5 v0.6.0 (2019-07-11)

Extensive changes in organization, but limited new functionality (not counting the CLI).

Enhancements

- Reorganize functions https://github.com/HallLab/clarite-python/pull/13
- Add a CLI https://github.com/HallLab/clarite-python/pull/11

8.1.6 v0.5.0 (2019-06-28)

Enhancements

- Added a function to recode values https://github.com/HallLab/clarite-python/issues/4
- Added a function to filter outlier values https://github.com/HallLab/clarite-python/issues/5
- Added a function to generate manhattan plots for multiple datasets together https://github.com/HallLab/ clarite-python/issues/9

Fixes

• Add some validation of input DataFrames to prevent some errors in calculations

Tests

· Added an initial batch of tests

8.1.7 v0.4.0 (2019-06-18)

Support EWAS with binary outcomes. Additional handling of NA values in covariates and the phenotype. Add a 'min_n' parameter to the ewas function to require a minimum number of observations after removing incomplete cases. Add additional functions including 'plot_distributions', 'merge_variables', 'get_correlations', 'get_freq_table', and 'get_percent_na'

8.1.8 v0.3.0 (2019-05-31)

Add support for complex survey designs

8.1.9 v0.2.1 (2019-05-02)

Added documentation for existing functions

8.1.10 v0.2.0 (2019-04-30)

First functional version. Mutliple methods are available under a 'clarite' Pandas accessor.

8.1.11 v0.1.0 (2019-04-23)

Initial Release
